

BARRIER[®] Shoulder drape with pouch

- Integrated fluid collection pouch for effective fluid management
- Strong reinforced materials in the critical zone provide reliable quality with high tear resistance
- Soft plastic edges against the wound area give optimal skin adhesion
- 100% impermeable materials providing optimal patient safety
- Optimal folding for aseptic application, easy for one person to drape

Draping instruction

1. Start by placing the stockinette over the hand without unfolding.

2. Note the direction of the pictogram on the first split sheet.

3. Position the split below the arm. Unfold the drape side to side and then towards the patient's feet. Unfold the split section towards the feet.

4. Unfold the stockinette. Fold the absorbent comfort layer of the stockinette in on itself to avoid the risk of microbial transfer. Fix it with the OP-tape.

5. Remove the release paper on the split sheet. Then apply the split as low as possible around the shoulder of the patient.

6. Note the direction of the pictogram on the second split sheet. Unfold the drape side to side and then towards the patient's head. Remove the release papers.

7. Apply the second split overlapping, but not directly on top of, the first split sheet to form a secure barrier.

8. Shape the pouch with the integrated flexi wires. Draping is then completed.
